High-Power Pneumatic Hole Clamp

Model SWE

By expansion of gripper, pull and clamp in workpiece hole

High clamping force which replaces hydraulics

Gripper expands and pulls workpiece down.

Clamping Force

2 kN

Supplying Air Pressure

0.45 MPa
Advantages

● To Workpiece
  - Zero interference with 5 faces except clamping face.
  - Possible to use standard length tool which provides for better precision.
  - Possible to enhance cutting parameters which leads to shorter cycle times.
  - Elimination of multiple setups provides better machining process and zero setup time.

● To Machining Equipment
  - No hydraulic equipment required by using high-power pneumatic hole clamp.
  - Fixture could be extremely downsized.
  - Turn-table could be downsized.
  - The movement of tool could be shorten.
  - For saving weight of fixture.
  - Machining equipment could be more simple.
  - Good design for easy flow of chips and reduction in coolant usage.

<Before> Clamping around the Workpiece

<After> Using the Hole Clamps

● To Machining Line
  - 5-face machining makes it possible to put process together.
  - Machining line is kept small and simple.
  - Possible to enhance cutting parameters which leads to shorter cycle times.

<Before> Large Machining Centers and Long Machining Lines

<After> Smaller Machining Centers and Shorter Machining Lines
● Variable Mounting Dimensions to Suit the Equipment
Able to design thinner plate since all pipes are set in flange.

● Seating Surface Height Suitable to Workpiece
Level the height in 5mm increments according to the phase of workpiece seating surface.
Hole Diameter to Suit a Variety of Workpieces

In order to suit different hole diameters and tolerances, hole diameters can be specified in 0.5mm increments.

More Powerful Clamping Force with Mechanical Lock

By mechanical lock system clamping force has extremely increased compared to our previous model SWH. SWE is useful for the machining that used to require hydraulic clamping systems.
Features

**Various Kinds of Protection by Cap Structure**

* SWE1000 has no cap structure.

- Minimum clearance between the cap and the gripper prevents cutting chips from entering inside the hole clamp.

- Small clearance leads to effective purging. Even with a little air flow it prevents coolant from entering inside the hole clamp.

- Workpiece does not have contact with gripper. It makes loading-unloading smooth.

- Rough guide is not necessary on fixture. * It differs according to the loading speed.
Pursuing Good Design for Cutting Chips

Having smaller seating surface and wide sweep area on the flange enables easy flow of cutting chips and reduction in coolant usage.

Secure Clamp Action Out of Sight

Spring for lifting grips a workpiece strongly and pulls it in. Even when air pressure is at zero, self-lock function by spring for locking ensures safety.

※This is a simplified drawing. Actual components are different.
**Features**

**Action Confirmation of Clamping**

Lift-up function allows to check the movement of pulling and lifting off the workpiece. It can be used in automated line.

**Abnormality Detection for Unpredictable Troubles**

Error detection for unpredictable troubles when processing or transferring. It can be used in automated line.
Action Description

This is a simplified drawing. Actual components are different.

- **Released State**
  1. Air pressure is supplied to the release port.
  2. The rod is lifted up and the gripper retracts.
     (For workpiece lifting option, there is a gap between workpiece bottom surface and seating surface.)

<table>
<thead>
<tr>
<th>Air Pressure Switch</th>
<th>Seat Check Detection (Air Sensor)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release Air Pressure</td>
<td>Lock Air Pressure</td>
</tr>
<tr>
<td>OFF</td>
<td>OFF</td>
</tr>
</tbody>
</table>

* Continuously supply air pressure to the air blow port and seating confirmation port. If clamps are used without air supply, contaminates enter into clamps resulting in clamping error.

- **Locked State**
  1. Air pressure is supplied to the lock port.
  2. The rod descends and the gripper expands along the taper plane. (Since the gripper is lifted by spring force, it does not pull down.)
  3. When pulling force exceeds the spring force for lift up, pulling force works after the gripper digs into workpiece. Then, it presses workpiece onto seating surface.
     (Clamping force = Pressing force onto seating surface.)

<table>
<thead>
<tr>
<th>Air Pressure Switch</th>
<th>Seat Check Detection (Air Sensor)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release Air Pressure</td>
<td>Lock Air Pressure</td>
</tr>
<tr>
<td>OFF</td>
<td>ON</td>
</tr>
</tbody>
</table>

- **Abnormality Detected State (Clamping without Workpiece)**

The built-in check valve function and seating confirmation air pressure detect abnormal condition as follows.

- When clamping workpiece which has larger workpiece hole diameter or clamping without workpiece (In this state the gripper expands but the lifting spring does not have pulling force so the workpiece lifting surface does not descend.)
- When rod or gripper is broken.
- If the piston is fully stroked when it has to stop at the bottom.
- In the case workpiece is floated more than 1mm when setting it.
Model No. Indication (Workpiece Hole Shape: Straight)

SWE 2000 – A – 115 – Blank F

1 Body Size ※ Please refer to specifications, performance curve and external dimensions for details.

1 : Available in workpiece hole diameters between \( \phi 6 \) and \( \phi 9 \) (No cap)
2 : Available in workpiece hole diameters between \( \phi 9 \) and \( \phi 13 \) (With cap)

2 Design No.

0 : Revision Number

3 Workpiece Lifting Option

A : With Lifting Function (Workpiece Lifting Option)
N : Without Lifting Function

The lifting function lifts the workpiece 0.2mm up from the seating surface when the clamp is released.

Note : When using SWE with expansion locating pin(s) (model VWH, VWM, VWK, VFH, VF, VFJ, VFK, VX), please choose N : Without Lifting Function.

4 Workpiece Hole Diameter (Workpiece Hole Code)

Workpiece Hole Diameter \( \phi d = 0.7 \)

※ Workpiece hole diameter should be specified in 0.5mm increments from the allowable range in the following table.

<table>

Notes:

1. The clamping part is an adjusting structure and the clamping operation is done by locating the workpiece hole. The numerical value in the table shows the amount of tolerance value of single clamp. Please consider the center distance accuracy of each clamping installation part and each workpiece hole when used with other location clamps / location cylinders, or when using more than two of these products.

2. Workpiece lifting stroke and workpiece lifting force are functions only for lifting option.

This drawing shows a combination mounting reference of SWE-N (Hole Clamp) and VWM (Expansion Locating Pin).

Notes:
1. In order to prevent the clamping part from damage, please set up rough guide of 2 or more when detaching a workpiece. Please refer to the above drawing for the length of rough guide and the diameter gap. (Use of rough guides depends on the loading / unloading condition of the workpiece.)
2. When using a combination of VWM (Expansion Locating Pin) and SWE-N (Hole Clamp), please choose N: Without lifting function.
Pneumatic Circuit Reference

This drawing shows a combination circuit reference of SWE-N (Hole Clamp) and VWM ( Expansion Locating Pin).

When controlled with one solenoid valve

Red colored part shows required circuit when using with VWM.

Air Sensor for Seating Check
Recommended: IGA3 series (SMC-made)
GPS3 series (CKD-made)

Recommended Air Pressure
SWE1000: 0.4 – 0.5MPa
SWE2000: 0.2 – 0.3MPa

When controlled with two solenoid valves

Red colored part shows required circuit when using with VWM.

Air Sensor for Seating Check
Recommended: IGA3 series (SMC-made)
GPS3 series (CKD-made)

Recommended Air Pressure
SWE1000: 0.4 – 0.5MPa
SWE2000: 0.2 – 0.3MPa

Condition for Operation Confirmation of Hole Clamp (Reference) ON: Pressure Increasing, OFF: Pressure Decreasing

Notes:

1. Please use solenoid valve to make a sequence operation that SWE (Hole Clamp) starts working after VWM (Expansion Locating Pin) completes the movement. When unable to use solenoid valve, please prepare flow control valve with check valve at ★ (1 piece) to adjust sequencing speed. If SWE operates before VWM, there is a possibility for the product to be damaged due to a thrust load on SWE.

2. In case high accuracy is required for air sensor setting, please install an air sensor for individual clamp.

3. With lifting function it shows "OFF" since there is a gap between seating surface and workpiece.

Without lifting function, it shows "ON" depending on set pressure of the air sensor.
Cautions

- Notes for Design

1) Check Specifications
- Please use each product according to the specifications.
- This product is an air double-acting model which locks with air pressure and spring force, and releases with air pressure.

- Even when air is not supplied to either lock port or release port, built-in spring maintains locked condition (clamp diameter is expanded):
  ① Maintains clamping force even when air pressure is at 0MPa. (Refer to the clamping force curve: clamping force at supply air pressure 0MPa on P.90).
  ② Supply release air when loading/unloading a workpiece.

- If release air is not supplied, the workpiece contacts with the gripper leading to breakage of the workpiece and the clamp.

2) Working Reference Plate (Seating Surface) Z axis.
- The upper surface of the flange of this product is the seating surface of workpiece and locates in Z direction.

- When clamping, make sure all seating surfaces touch a workpiece.

- When the workpiece is not touching the seating surface area, please refer to external dimension chart and calculate contacting pressure with clamping force and seating area not to deform the workpiece.

3) Seating Confirmation Mechanism
- It will be detected when a workpiece is pressed against the seating surface by locking (clamping) action.

4) Clamp Installation
- The clamping part of this product has floating structure (±0.5mm). Please consider the center distance accuracy of each clamping installation part and each workpiece hole when used with other location clamps / location cylinders, or when using more than two of these products.

5) Clamping Force
- Clamping force shows a pressing force against the seating surface.

- Make sure to conduct test clamping and adjust supply pressure accordingly. Insufficient clamping force leads to workpiece detachment.

6) Workpiece hole size, slope angle and workpiece hardness should be within the range of the specification.

---

7) Wall Thickness around Workpiece Hole
- Thin wall around the workpiece hole could be deformed by clamping action, and clamping force does not fill the specification. Make sure to conduct test clamping and adjust supply pressure accordingly. Insufficient clamping force leads to workpiece detachment.

8) Air Blow Port and Seating Confirmation Port
- Continuously supply air pressure to the air blow port and the seating confirmation port.

- If air supply is shut off during operation, contaminants enter into the clamp leading to malfunctions.
9) Release Action

- When releasing, it lifts up a workpiece which is normal. When using in a horizontal application, it is recommended to install a fall prevention of workpiece for temporal tacking.

![Temporal Tacking](image)

10) Horizontal Locating

- When a workpiece is set, please make sure there is no lifting or slope of the workpiece. If the clamping operation is done with lifting or slope of the workpiece, it will lead to possible damage of a clamp and deformation of the workpiece hole.

11) Please detach a workpiece with all clamps fully released.

- When a workpiece is detached during lock or release operation, it will lead to damage of clamp or fall of workpiece.

12) Please set up rough guides.

- When detaching a workpiece with slope it may cause damage of clamp or fall of workpiece.

![Detaching Workpiece](image)

When using the product with other location clamps / cylinders, please set rough guides considering the center distance accuracy of each mounting hole and workpiece hole of location clamp / cylinder.

13) Damage Prevention during Robot Handling, etc.

- When inserting the SWE tip into/taking it out of a workpiece hole, the SWE tip has to be vertical to the workpiece hole. Especially after releasing a workpiece, the SWE tip must be fully taken out from the workpiece hole before moving to a next coordinate.

![Damage Prevention](image)

- If the SWE tip touches a workpiece when inserting, control the insertion speed to avoid damage on the workpiece and the SWE tip.

- When SWE is clamping/releasing a workpiece, make sure that the robot operates only after SWE completes clamping/releasing action by using a sensor or a timer. If the robot starts operating in the middle of clamping/releasing action, the workpiece may be fallen off.

- When clamping/releasing a workpiece, it may be tilted due to a gap between the workpiece and the stand. This causes damage of SWE. The gap has to be minimized as much as possible when clamping/releasing.

![Large/Minimal Gap](image)

※ Please refer to P.1357 for common cautions.

- Notes on Handling
- Maintenance/Inspection
- Warranty
Cautions

- **Installation Notes**

1) Check the Usable Fluid
- Make sure to supply filtered clean dry air.
- Oil supply with a lubricator etc. is unnecessary.

2) Procedure before Piping
- The pipeline, piping connector and fixture circuits should be cleaned by thorough flushing.
- Dust and cutting chips in the circuit may lead to air leakage and malfunction.
- There is no filter provided with this product to prevent contaminants from getting into the air circuit.

3) Applying Sealing Tape
- Wrap with tape 1 to 2 times following the screw direction.
- Pieces of the sealing tape can lead to air leakage and malfunction.
- In order to prevent contamination during the piping work, it should be carefully cleaned before working.

4) Installation of the Product
- When mounting the product, use all hexagon socket bolts (with tensile strength of 12.9) and tighten them with the torque shown in the following table.

<table>
<thead>
<tr>
<th>Model No.</th>
<th>Mounting Bolt Size</th>
<th>Tightening Torque (N-m)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SWE</td>
<td>M5 × 0.8</td>
<td>6.3</td>
</tr>
</tbody>
</table>

5) Port Position of the Hole Clamp
- The port names are marked on the product surface.
- Be careful of installation direction.
- (LOCK : Air Lock Port, RELEASE : Air Release Port, FC : Seating Confirmation Port, BLOW : Air Blow Port)

6) Use air piping with outer diameter Ø 6 (inner diameter Ø 4) or larger for air blow.
- In order to conduct an effective air blow, it is recommended to use air piping with outer diameter Ø 6 (inner diameter Ø 4) or larger.

- **Notes on Handling**

1) It should be handled by qualified personnel.
- Machines and devices with hydraulic and pneumatic equipment should be handled and maintained by qualified personnel.

2) Do not handle or remove the product unless the safety protocols are ensured.
   - The machine and equipment can only be inspected or prepared when it is confirmed that the preventive devices are in place.
   - Before the product is removed, make sure that the above-mentioned safety measures are in place. Shut off the pressure and power source, and make sure no pressure exists in the air and hydraulic circuits.
   - After stopping the product, do not remove until the temperature drops.
   - Make sure there is no abnormality in the bolts and respective parts before restarting the machine or equipment.

3) Do not touch workpieces (pallets) or clamps while they are working.
- Otherwise, your hands may be injured due to clinching.

4) Do not disassemble or modify.
- If the equipment is taken apart or modified, the warranty will be voided even within the warranty period.
- Built-in spring is very strong and can be dangerous.
● Maintenance and Inspection

1) Please refer to P.1357 for general maintenance and inspection.

2) Regularly clean the clamping part and the seating surface. There is an air blow mechanism in this product, and cutting chips and coolant can be removed. However, as it may be hard to remove clinging cutting chips, sludge, etc., please confirm there are no contaminants when a workpiece is set. If operating with dirt adhering to the clamping part, it will lead to a workpiece fall due to insufficient clamping force, defective operation, and air leakage etc.

3) Clamping force will be decreased by friction of a gripper surface due to repeated operation. Replacement period differs depending on operating air pressure, workpiece material and shape of hole. When you find friction on gripper surface, the gripper needs to be replaced. Please contact us for replacement.

4) Please contact us for overhaul and repairs. Built-in spring is very strong and can be dangerous.

※ Please refer to P.1357 for common cautions. • Notes on Handling • Maintenance/Inspection • Warranty
Cautions

• Notes on Handling
  1) It should be operated by qualified personnel.
     • The hydraulic machine and air compressor should be operated
       and maintained by qualified personnel.
  2) Do not operate or remove the product unless the safety protocols
     are ensured.
     ① The machine and equipment can only be inspected or prepared
       when it is confirmed that the safety devices are in place.
     ② Before the product is removed, make sure that the above-mentioned
       safety devices are in place. Shut off the pressure and power source,
       and make sure no pressure exists in the air and hydraulic circuits.
     ③ After stopping the product, do not remove until the temperature
       drops.
     ④ Make sure there is no abnormality in the bolts and respective parts
       before restarting the machine or equipment.
  3) Do not touch a clamp (cylinder) while it is working.
     Otherwise, your hands may be injured due to clinching.

  4) Do not disassemble or modify.
     • If the equipment is taken apart or modified, the warranty will be
       voided even within the warranty period.

• Maintenance and Inspection
  1) Removal of the Machine and Shut-off of Pressure Source
     • Before the machine is removed, make sure that safety devices
       and preventive devices are in place. Shut off the pressure and
       power source, and make sure no pressure exists in the air and
       hydraulic circuits.
     • Make sure there is no abnormality in the bolts and respective parts
       before restarting.
  2) Regularly clean the area around the piston rod and plunger.
     • If it is used when the surface is contaminated with dirt, it may lead
       to packing seal damage, malfunctioning and fluid leakage.

  3) Please clean out the reference surfaces on a regular basis (taper
     reference surface and seating surface) of the locating products:
     (VS/VT/VFL/VFM/VJF/VFK/WVS/WVM/VX/VXE/VXF)
     • The locating products, except VX/VXE/VXF model, can remove
       contaminants with cleaning functions. However, hardened cutting
       chips, adhesive coolant and others may not be removed. Make sure
       there are no contaminants before installing a workpiece/pallet.
     • Continuous use with contaminant on components will lead to
       locating accuracy failure, malfunction and fluid leakage.

  4) If disconnecting by couplers, air bleeding should be carried out
     on a regular basis to avoid air mixed in the circuit.
  5) Regularly tighten nut, bolt, pin, cylinder, pipe line and others to
     ensure proper use.
  6) Make sure the hydraulic fluid has not deteriorated.
  7) Make sure there is a smooth action without an irregular noise.
     • Especially when it is restarted after left unused for a long period,
       make sure it can be operated correctly.
  8) The products should be stored in the cool and dark place
     without direct sunshine or moisture.
  9) Please contact us for overhaul and repair.
Warranty

1) Warranty Period
   ● The product warranty period is 18 months from shipment from our factory or 12 months from initial use, whichever is earlier.

2) Warranty Scope
   ● If the product is damaged or malfunctions during the warranty period due to faulty design, materials or workmanship, we will replace or repair the defective part at our expense.
   Defects or failures caused by the following are not covered.
   1) If the stipulated maintenance and inspection are not carried out.
   2) If the product is used while it is not suitable for use based on the operator’s judgment, resulting in defect.
   3) If it is used or operated in an inappropriate way by the operator. (Including damage caused by the misconduct of the third party.)
   4) If the defect is caused by reasons other than our responsibility.
   5) If repair or modifications are carried out by anyone other than Kosmek, or without our approval and confirmation, it will void warranty.
   6) Other caused by natural disasters or calamities not attributable to our company.
   7) Parts or replacement expenses due to parts consumption and deterioration.
      (Such as rubber, plastic, seal material and some electric components.)

   Damages excluding from direct result of a product defect shall be excluded from the warranty.
